Complete Accepted: May 31, 1923.

COMPLETE SPECIFICATION.

Improvements in and relating to Confections or Sweetmeats.

JOHN DAVID ARMSTRONG, Gentle-
man of 17, Lorain Road, City of North
Oxford, County of Cuyahoga, and
State of Ohio, of the United States of
America, a citizen of the United States
of America, do hereby declare the nature
of this invention, and in what manner
the same is to be performed, to be par-
ticularly described and ascertained in
the following statement:

It is the object of this invention to
provide a novel confection em-
bodying the invention constitutes a candy
container having a congealed filler and
the primary objects of the inven-
tion are to provide novel means for sealing
the container.

Another important object of the in-
vention is to provide means whereby
the frozen delicacy may be consumed
in a convenient manner and without
at such time breaking open the container
so that if one desires, the contents
of the container may be consumed,
after which the container itself may be

Another object of the invention is to
construct the walls of the container
in one embodiment of the invention,
in a novel manner so as to afford a variety
of textures combined in a way to be
appealing to the palate.

In the accompanying drawings
Figure 1 is a perspective view of a part
broken away, illustrating one em-
bodiment of the invention.

Figure 2 is a vertical transverse sec-
tion of the container as shown

Figure 3 is a perspective view of a part
broken away, illustrating another form of the invention.

Figure 4 is a longitudinal sectional
view through another form of the in-
vention.

Figure 5 is a perspective view of a

trating a further modification of the
invention.

The confection embodying the in-
vention resembles somewhat in its
general appearance, the candy product
commonly known as "snickers" and
in that form of the invention shown in
Figs. 1 and 2 of the drawings, it consists
of a body which is indicated in gen-
eral by the numeral 1 and is substantially
framed sided, having a side wall 2, an
opposed end wall 3, and a top wall 4,
or otherwise formed from candy material
and is initially left open at its end op-
posite its end wall 3. Any material may
be employed for the purpose, such for
example as the flavored sugar mixture
employed in making hard candy, and
the walls of the body may be of any
desired thickness and the body as a
whole may be given any desired form
other than that illustrated in the drawings
if this should be found desirable. The
numeral 5 indicates a filler which will
usually be of some congealed delicacy
such for example as ice cream, and the
filler occupies a substantial portion of the
interior of the body 1. The body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

After such immersion, the body 1
is withdrawn from the liquid candy material
and the liquid taken into the body 1
hardens, thus sealing the end 3 of the
body 1.

Figure 3 is a perspective view of a part
broken away, illustrating another form of
the invention. In this form, the body 1
is of a different shape, being more
tapered at its end 3, and the filler 5
is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

Figure 4 is a longitudinal sectional
view through another form of the in-
vention. In this form, the body 1
is of a different shape, being more
tapered at its end 3, and the filler 5
is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

Figure 5 is a perspective view of a
part broken away, illustrating another
form of the invention. In this form,
the body 1 is of a different shape, being
more tapered at its end 3, and the filler
5 is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

Figure 6 is a perspective view of a
part broken away, illustrating another
form of the invention. In this form,
the body 1 is of a different shape, being
more tapered at its end 3, and the filler
5 is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

Figure 7 is a perspective view of a
part broken away, illustrating another
form of the invention. In this form,
the body 1 is of a different shape, being
more tapered at its end 3, and the filler
5 is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

Figure 8 is a perspective view of a
part broken away, illustrating another
form of the invention. In this form,
the body 1 is of a different shape, being
more tapered at its end 3, and the filler
5 is of a different shape, being more
tapered at its end 3, and the body 1
is initially open at its end 3, and
after the filler 5 has been introduced
into the body, this end of the body is
sealed by immersing it momentarily in
the liquid candy material.

NOT AVAILABLE COPY

of the said body 1 and communicates with the interior of the body as most clearly shown in Fig. 2 of the drawings. The stem 7 performs several functions.

- 5 In the first place it constitutes a handle for the body 1, and also it serves as a medium through which the congealed contents of the container body may be drawn by placing the free end of the stem in the mouth. In this form of the invention the body 1 may be wrapped and protected in any desired manner as, for example, by applying about it a paper wrapper indicated by the numeral 15. This wrapper 8 may enclose the body 1 alone, or it may extend also over the stem 7.

From the foregoing description of this form of the invention it will be evident that one may employ the stem 7 for the purpose of consuming the filler 5, or the said stem may be made use of solely as a handle. It will also be understood that the confection may be consumed by first consuming the filler 5 by drawing the same through the hollow stem 7, the body 1 being subsequently eaten or the body may be consumed with the filler. Also it will be evident that if the filler 5 cannot be readily drawn through the hollow stem 7 because of the lack of a vent in the walls of the body, such a vent may be provided by puncturing the seal 6.

- 35 In that form of the invention shown in Fig. 3 of the drawings, the body is indicated in general by the numeral 9 and comprises side walls 10 and 11 corresponding to the walls 2 and 3 previously described, the body being closed at its lower end by an end wall 12, one end of a tubular stem 13, corresponding to the stem 7 previously described, being fitted through the wall 12 of the body 9 and serving precisely the same purposes as the said stem 7. In this form of the invention the walls 10 and 11 and the end wall 12 comprise inner and outer sections 14 and 15 respectively which are molded from candy material such as that previously described, and are connected at the initially open end of the body 9 by a bridge wall 16. Between the wall sections 14 and 15 and filling the space defined thereby, a third or filler section 17 is provided and this section is preferably of some kind of cake material. After the body 9 has been filled with the frozen delicacy previously described, in this form by the numeral 18, the initially open end of the container is sealed or closed by dipping it into a candy batch

this seal being 19. A wrapper of material indicated by the numeral 20 may be applied about the body 1, so as to enclose said body and protect it until the confection is to be consumed. It will be evident that in this embodiment of the invention, the purchaser is afforded a frozen delicacy, candy and cake.

Figure 4 of the drawings illustrates a modification in which the body of the confection indicated by the numeral 21 is initially formed in halves, as is also the tubular stem indicated by the numeral 22. Having formed these parts in halves as stated, and having united the ends of the stem halves 22 to the halves of the body 21, the said halves of the body are filled with ice cream or any other frozen or congealed delicacy as indicated by the numeral 23 and the two sections of the article are then brought together and united in any desired manner.

In the form of the invention shown in Fig. 5, the body, which is indicated by the numeral 24, is substantially identical in form with the body shown in Figs. 1 and 2 of the drawings, except that in this case the body is molded from some soft candy material such, for example, as that employed in making gum drops, and the walls of the body are therefore yieldable, thus adapting the body to be squeezed or compressed between the fingers so as to eject the filler therefrom and through the tubular stem.

Having now particularly described and ascertained the nature of my said invention, and in what manner the same is to be performed, I declare that what I claim is:

1. A confection comprising a hollow edible body, a congealed edible filler therein, and a tubular stem opening into the body.

2. A confection comprising a hollow edible body, a congealed edible filler therein, means sealing the body, and a tubular stem fitted through one wall of the body and communicating with the interior of the body.

3. A confection comprising a hollow edible body, of candy material, open at one end, a seal of similar material closing said end, and a tubular stem opening into the body.

4. A confection comprising a hollow edible body of candy material, open at one end, a seal of similar material closing said end, and a tubular stem opening into the body.

BEST AVAILABLE COPY

stem opening into the body through one wall thereof.

5. A confection comprising a hollow edible body, the walls of which are yieldable, the body having an outlet, and a plastic edible filling in said body.

6. A confection comprising a hollow edible body, the walls of which comprise inner and outer candy sections suitably

spaced, and a wall section of said material filling said space.

Dated this 11th day of October, 1922.
